Docket No. 1374.39812VV2  
Serial No. 10/639,465  
July 5, 2006**AMENDMENTS TO THE CLAIMS:**

The following listing of claims replaces all prior listings, and all prior versions, of claims in the application.

**LISTING OF CLAIMS:**

1. (Original) A method of fabricating a semiconductor integrated circuit device, comprising the steps of:
  - (a) forming a gate insulating film over a semiconductor wafer;
  - (b) depositing a gate electrode forming film having an SiGe layer over the gate insulating film;
  - (c) forming at least one electrode having the SiGe layer by patterning the gate electrode forming film; and
  - (d) after the step (c), subjecting the semiconductor wafer to a plasma processing in an atmosphere of a mixed gas of a first gas less reactive to Ge as compared with oxygen gas and a second gas having a function of etching Si.
2. – 4. (Cancelled).
5. (Original) A method of fabricating a semiconductor integrated circuit device according to Claim 1, wherein the second gas is a gas including fluorine.
6. (Original) A method of fabricating a semiconductor integrated circuit device according to Claim 5, wherein the gas including fluorine is  $\text{CHF}_3$ .

Docket No. 1374.39812VV2  
Serial No. 10/639,465  
July 5, 2006

7. (Original) A method of fabricating a semiconductor integrated circuit device according to Claim 1, wherein a concentration of the first gas is relatively higher than a concentration of the second gas.

8. (Original) A method of fabricating a semiconductor integrated circuit device according to Claim 1, wherein a concentration of Ge of the SiGe layer is equal to or larger than 10% of a total thereof.

9. (Original) A method of fabricating a semiconductor integrated circuit device according to Claim 1, wherein a concentration of Ge of the SiGe layer is equal to or larger than 20% of a total thereof.

10. (Original) A method of fabricating a semiconductor integrated circuit device according to Claim 1, wherein a concentration of Ge of the SiGe layer is equal to or larger than 40% of a total thereof.

11. (Original) A method of fabricating a semiconductor integrated circuit device according to Claim 1, wherein a side etching amount at two side faces of the at least one gate electrode, after the step (d), is equal to or smaller than 40% of a length, in a channel length direction, at a portion of the gate electrode forming film left after the step (c) other than the SiGe layer.

12. (Currently amended) A method of fabricating a semiconductor integrated circuit device according to Claim 1, wherein a width of length in a channel  
~~length direction at the SiGe layer of the at least one gate electrode, after the step (d),~~

Docket No. 1374.39812VV2

Serial No. 10/639,465

July 5, 2006

is substantially equal to that of other layers ~~a length in the channel length direction at~~  
~~a portion of the at least one gate electrode, after the step (d) other than the SiGe~~  
layer.

13. (Original) A method of fabricating a semiconductor integrated circuit device according to Claim 1, wherein at least two gate electrodes are formed in the step (c), and wherein a field effect transistor of an n-channel type and a field effect transistor of a p-channel type having the gate electrodes are formed at the semiconductor wafer.

14. (Original) A method of fabricating a semiconductor integrated circuit device according to Claim 1, wherein the semiconductor wafer after the step (c) is transferred to the step (d) in a state of maintaining a vacuum state.

15. (Original) A method of fabricating a semiconductor integrated circuit device according to Claim 1, wherein the step (b) includes a step of introducing boron to the gate electrode forming film.

16. (Original) A method of fabricating a semiconductor integrated circuit device according to Claim 1, wherein the step (b) includes a step of depositing a silicon layer over the SiGe layer, and, after the step (d), the method further comprises the steps of:

(e) forming side wall insulating films at side faces of the at least one gate electrode;

Docket No. 1374.39812VV2  
Serial No. 10/639,465  
July 5, 2006

(f) exposing an upper face of the at least one gate electrode and portions of a main face of the semiconductor wafer;

(g) depositing a metal film having a high melting point over the semiconductor wafer; and

(h) forming a metal silicide layer having a high melting point at the upper face of the gate electrode and the portions of the main face of the semiconductor wafer.

17. (Original) A method of fabricating a semiconductor integrated circuit device, comprising the steps of:

(a) forming a gate insulating film over a main face of a semiconductor wafer;

(b) depositing a gate electrode forming film over the gate insulating film;

(c) forming a gate electrode by patterning the gate electrode forming film; and

(d) after the step (c), subjecting the semiconductor wafer to a plasma processing in an atmosphere of a mixed gas of a first gas less reactive to Ge as compared with oxygen gas and a second gas having a function of etching Si,

wherein step (b) comprises the substeps of:

(i) depositing an SiGe layer; and

(ii) depositing a silicon layer over the SiGe layer.

18. – 20. (Cancelled).

Docket No. 1374.39812VV2  
Serial No. 10/639,465  
July 5, 2006

21. (Original) A method of fabricating a semiconductor integrated circuit device according to Claim 17, wherein the second gas is a gas including fluorine.

22. (Original) A method of fabricating a semiconductor integrated circuit device according to Claim 21, wherein the gas including fluorine is  $\text{CHF}_3$ .

23. (Original) A method of fabricating a semiconductor integrated circuit device according to Claim 17, wherein a concentration of Ge of the SiGe layer is equal to or larger than 10% of a total thereof.

24. (Original) A method of fabricating a semiconductor integrated circuit device according to Claim 17, wherein a side etching amount at two side faces of the gate electrode, after the step (d), is equal to or smaller than 40% of a length in a channel length direction of the silicon layer left after the step (c).

25. (Original) A method of fabricating a semiconductor integrated circuit device according to Claim 17, wherein after the step (d), further comprising the steps of:

- (e) forming side wall insulating films at side faces of the gate electrode;
- (f) exposing an upper face of the gate electrode and portions of a main face of the semiconductor wafer;
- (g) depositing a metal film having a high melting point over the semiconductor wafer; and

Docket No. 1374.39812VV2  
Serial No. 10/639,465  
July 5, 2006

(h) forming a metal silicide layer having a high melting point at the upper face of the gate electrode and the portions of the main face of the semiconductor wafer.

26. (Original) A method of fabricating a semiconductor integrated circuit device according to claim 17, further comprising the steps of:

after the step (d), introducing a first impurity to an area for forming a field effect transistor of an n-channel type in the semiconductor wafer; and

after the step (d), introducing a second impurity, for forming a semiconductor area of a conductivity type opposite to a conductivity type of a semiconductor area formed by a first impurity, to an area for forming a field effect transistor of a p-channel type in the semiconductor wafer.

27. (Original) A method of fabricating a semiconductor integrated circuit device, comprising the steps of:

(a) forming a gate insulating film over a main face of the semiconductor wafer;

(b) depositing a gate electrode forming film over the gate insulating film;

(c) forming a gate electrode by patterning the gate electrode forming film; and

(d) after the step (c), subjecting the semiconductor wafer to a plasma processing in an atmosphere of a mixed gas of a first gas less reactive to Ge as compared with oxygen gas and a second gas having a function of etching Si, and

wherein step (b) comprises the substeps of:

(i) depositing an SiGe layer; and

Docket No. 1374.39812VV2  
Serial No. 10/639,465  
July 5, 2006

- (ii) depositing a metal layer over the SiGe layer.

28. (Original) A method of fabricating a semiconductor integrated circuit device according to Claim 27, wherein a side etching amount at two side faces of the gate electrode after the step (d) is equal to or smaller than 40% of a length in a channel length direction of the metal layer after the step (c).

29. (Original) A method of fabricating a semiconductor integrated circuit device according to Claim 27, wherein the step (b) includes a step of depositing the metal layer after introducing boron to the SiGe layer.
